Assignment 2 – Setup & Submission Instructions

Step 1 – Update Your Local Repository

On your local system, open a terminal and navigate to your existing `CSC4575` repository.

Run:

```
git pull
```

If you have **not** previously cloned the class repository, run:

```
git clone https://github.com/elbrown-tntech/CSC4575
```

This will download the latest course materials, including the Assignment 2 notebook.

Step 2 – Locate the Assignment 2 Notebook

After updating your repository:

1. Open the `CSC4575` folder in Visual Studio Code.
2. Navigate to the appropriate module directory.
3. Open the Assignment 2 Jupyter notebook (`.ipynb`) file.

Make sure you are working in the correct file before beginning.

Working in the Jupyter Notebook

This assignment must be completed directly inside the provided Jupyter notebook.

You are expected to:

- Execute all required code cells
- Provide written explanations in Markdown cells
- Interpret your results clearly and professionally
- Ensure the notebook runs cleanly from top to bottom

Before submitting, you must:

1. Click **Kernel → Restart & Run All**

2. Confirm that:

    - All cells execute without errors

    - Output appears correctly
    - No debugging or unnecessary print statements remain

Your notebook should demonstrate:

- Technical correctness
- Clear reasoning
- Professional documentation

Exporting Your PDF

After completing the notebook:

1. Follow the instructions in the **Clean PDF Export Guide**

2. Export your notebook to PDF

3. Verify that:

    - Code
    - Output
    - Written explanations all appear correctly in the exported file

If the PDF formatting is broken, correct it before submitting.

Submission Requirements

You must upload **both** of the following files to iLearn:

- The completed `.ipynb` file
- The exported `.pdf` file

Failure to submit both files may result in a deduction.

Perfect — here is the updated Markdown with a concise grading rubric section added in a style consistent with CSC 4575 expectations.

You can paste this directly below the “Submission Requirements” section.

Grading Rubric (20 Points Total)

Your submission will be evaluated using the following criteria:

1. Technical Correctness (8 points)

- Code executes without errors

- Required computations are implemented correctly
- Output reflects accurate results
- Notebook runs cleanly using **Restart & Run All**

Partial credit may be awarded for minor errors that do not fundamentally break the solution.

---

2. Explanation & Analysis (6 points)

- Clear written explanations in Markdown cells
- Demonstrates understanding of the concepts
- Accurately interprets results
- Connects output to underlying principles

Answers that simply restate the output without explanation will receive reduced credit.

---

3. Completeness (4 points)

- All required sections completed
- All questions addressed
- Required outputs included
- Both `.ipynb` and `.pdf` submitted

Missing sections or incomplete responses will result in deductions.

---

4. Professional Presentation (2 points)

- Clean formatting
- No unnecessary debug statements
- Logical organization
- Proper grammar and technical clarity

Submissions should reflect professional cybersecurity workflow standards.

Important

Before submitting:

- Use **Restart & Run All**
- Confirm there are no execution errors
- Verify your exported PDF contains:
    - Code
    - Output
    - Explanations

Environment Requirements

You must complete this assignment using:

- Python 3
- Visual Studio Code
- Jupyter extension

If your notebook will not run:

- Verify the **Python** extension is installed
- Verify the **Jupyter** extension is installed
- Restart VS Code
- Re-select the correct Python kernel

Professional Expectations

This assignment mirrors real-world cybersecurity and research workflow:

- Reproducible execution
- Clear documentation
- Logical reasoning
- Clean technical presentation

Your submission should reflect professional standards in both computation and explanation.
